Prepared by
Department of Environmental Quality
for the
Environmental Quality Council

Report Author: Paul Cartwright

The chance that foreign events will disrupt the petroleum markets is growing. Though the sources of the petroleum products used in Montana are relatively secure, Montana is part of an international market. Price changes in that market are quickly reflected in the Montana market. Steep increases in the price of petroleum products will affect all Montanans. This report provides the background information the Legislature and the public may need to respond to energy disruptions that may occur.

PETROLEUM AND PETROLEUM PRODUCTS IN MONTANA

Montana Petroleum Quick Facts (in round numbers)

Recent production: 16 million barrels per year

Amount of crude production exported: 75 percent

Refineries in state: Billings (2), Laurel, Great Falls

Crude receipts at refineries: 57 million barrels per year

Source of crude refined in state:

Montana – 6 percent

Alberta – 73 percent

Wyoming – 20 percent

Amount of liquid fuel refined products exported: 60 percent

States petroleum products are exported to:

Washington

North Dakota

Wyoming (and points south)

Montana consumption of petroleum products: 31 million barrels (includes refinery usage)

Gasoline sold in-state: 500 million gallons

1. Production History

The first oil wells drilled in Montana were located in the Butcher Creek drainage between Roscoe and Red Lodge, beginning in 1889. These wells were not very successful. The first significant oil production in the state came from wells drilled in the northward extension of Wyoming's Elk Basin field in 1915, southeast of Belfry. Montana's first new oil field was Cat Creek, near Winnett, discovered in 1920, soon followed by the Kevin Sunburst field discovery in 1922. Over the next 40 years, more oil fields were developed in the Williston Basin (northeast Montana), the Sweetgrass Arch (northern Montana), the Big Snowy Uplift (central Montana), the northern extensions of Wyoming's Big Horn Basin (south central Montana) and the Powder River Basin (southeastern Montana).

Montana's petroleum production peaked in 1968 at 48.5 million barrels (1 barrel = 42 gallons), the result of cresting Williston Basin production combined with a surge of production from the newly discovered Bell Creek field in the Powder River Basin (Table P1; Fig. P1, below). Production then declined quickly until 1971, when a series of world oil supply shocks began to push prices upward, stimulating more drilling. Production remained relatively stable between 1971 and 1974 as Powder River Basin output increased to match a decline in Williston Basin output. After 1974 production began to decline, despite the continued escalation of oil prices (Table P2).

Figure P1. Historical Oil Production 1955-2001

World oil price shocks following the Iran crisis in 1979 sparked a drilling boom, which peaked at 1,149 new wells of all types in 1981 (Table P3). That year, the average price of Montana crude climbed to almost \$35 per barrel. While the increase in the price of oil encouraged more drilling, it did little to increase Montana production (Fig. P2).

Figure P2. Production vs. Price, 1955-1997

The drilling produced a high percentage of dry holes and was unable to slow the decline in statewide production (Fig. P3).

Figure P3. Oil Production and Oil Well Completions, 1955-2001

Output increased in the Williston Basin during the early 1980s, but this was matched by a steep decline in output from other areas. Production declined significantly following the drop in world oil prices in 1985, stabilizing around 16 million barrels per year in the mid-1990's. Wells in Montana are not that prolific, averaging around 15 barrels per day in recent years (Table P1).

2. Refineries and Pipelines

Petroleum pipelines serving Montana consist of three separate systems (see Map, below.) One bridges the Williston and Powder River basins in the east and the other two link the Sweetgrass Arch, Big Snowy and Big Horn producing areas in central Montana. (A fourth—Express—primarily carries Canadian crude through Montana.) All these systems also move crude oil from Canada to Montana and Wyoming. In recent years, 75-80 percent of Montana oil production has been exported from the state, mostly to Wyoming through the eastern pipeline system. This pipeline system is not connected to any of the Montana refineries, which limits the amount of Montana crude they can use.

Montana refineries now use around 57 million barrels of crude a year (Table P4). In the last decade, only 5-10 percent of that came from Montana crude. Oil fields in the Sweetgrass Arch, Big Snowy and Big Horn areas provided crude to the four Montana refineries: Cenex in Laurel, Montana Refining in Great Falls, ConocoPhillips and ExxonMobil in Billings. Collectively, 70-75 percent of their crude oil came from Alberta, Canada and around 20 percent came from Wyoming. The shipments from Canada have increased since the late 1960s, as Montana oil production and imports of Wyoming crude declined. (Fig. P4, below)

MAP: Petroleum Pipelines in Montana

Figure P4. Refinery Receipts by Source of Oil, 1955-2001

**Fig. P4. Refinery Receipts by Source
of Oil, 1955-2001**

Source: Table P4

The refineries vary in their sources of crude inputs (Table P5). ConocoPhillips is the most dependent on Canadian crude, taking an average (1996-2001) of 94 percent of its total receipts from Canada. ExxonMobil is the least dependent on Canadian crude (39 percent of receipts) but by far the most dependent on Wyoming (53 percent of receipts).

Almost all of refinery output is moved by pipeline. Montana refineries ship their products to Montana cities and east to Fargo, North Dakota (Cenex pipeline), to Wyoming and further south (Conoco Seminoe pipeline) and west to Spokane and Moses Lake, Washington (Conoco Yellowstone pipeline). In 2001, 29 million barrels of product were shipped out of state, in roughly similar portions on each pipeline, with the largest portion heading south.

The four refineries provided almost all of the petroleum products consumed in Montana. Beyond that, around 55-60 percent of the liquid fuel produced at the refineries is exported. Montana refineries provided about 10% of Washington's gasoline and distillate in 2001. That same year, North Dakota received over half its gasoline and distillate from Montana refineries.

3. Petroleum Products Consumption

Petroleum product consumption in Montana peaked at 33 million barrels in 1979 (Table P6). It then drifted lower, settling in the mid-1980's around 24 million barrels per year. After that, consumption began a slow climb, to around 31 million barrels per year at present.

The transportation sector is the single largest user of petroleum and the second largest user of all forms of energy in Montana. In 1999, 38 percent of consumption was in the form of motor gasoline, 28 percent was distillate, mostly diesel fuel, and 9 percent was asphalt and road oil. Another 19 percent was consumed in petroleum industry operations (Table P6).

Gasoline use peaked in 1978, at half a billion gallons, dropped and slowly climbed back to around that level currently, with minor fluctuations since the mid-1990s (Tables P10 and P11). Diesel use generally has increased since the 1970's, though use may be flattening out now. During the 1990's, highway diesel use grew at a far greater rate than did gasoline use (Tables P11; Fig. P5, below).

Figure P5. Annual Sales by Prime Suppliers

The fluctuations in demand for gasoline and diesel fuel since 1970 reflect changes in the state and national economy and the international price of oil. The embargo by the Organization of Petroleum Exporting Countries (OPEC) in 1973-1974 and the Iranian crisis of 1979-1980 drove prices up and demand down. The increase in prices prompted advances in vehicle efficiency and a fuel switch by heavy-duty trucks from gasoline to diesel. The crash in international prices in 1985, the economic growth of the 1980's and 1990's, along with the decline in vehicle fleet fuel efficiency in recent years pushed gasoline and diesel demand back up.

Fuel use shows a cyclical rise and fall through the year (Tables 12a and 12b; Fig. P6, below). Use tends to rise during the summer months and taper off during the winter. Diesel use also shows a modest peak in the spring, and a greater one at the end of the summer, possibly due to agricultural sector use. The winter trough in fuel use is more than a third lower from the summer peak. This seasonal pattern is caused both by variations in the use of Montana's one million vehicles and by the increase in tourist traffic during the summer.

Figure P6. Average Monthly Sales by Prime Suppliers, 1990-2001

Note: Prime suppliers are those who provide product to local distributors or retailers.

The price of gasoline has been rising over the last decade, most significantly in the last few years (Table P13 and P14; Fig. P7)

Figure P7. Retail Price of Gasoline, 1990-2002

The price of gasoline can vary significantly around the state, a fact that is masked by the data, which only are available as statewide averages. (Complete data on the Montana price of diesel were not available.) The price of gasoline has a cyclical rise and fall, just like demand for gasoline; however, price lags demand, with peak prices tending to appear after the peak driving season (Fig. P8).

Figure P8. Average Monthly Price of Gasoline vs. Sales, 1990-2001

4. Comments on the data

Data for this report come from a variety of sources, which don't always agree exactly. In part this is due to slightly different data definitions and methods of data collection. The reader should always consider the source and context of specific data.

Table P1. Average Daily Oil Production per Well and Annual Production by Region, 1955-2001

Year	Average Daily Production per Well (barrels)						Oil Production by Region (barrels)						TOTAL
	North	South	Central	Williston Basin	Powder River Basin	STATE AVERAGE	North	South Central	Williston Basin	Powder River Basin	Williston Basin	Powder River Basin

DoR Statistics

Fiscal Year	Crude Oil Production (Mbbls)	Average Wellhead Price (\$/bbl)	Gross Value of Production (million \$)
FY1995	16,448	14.60	240.1
FY1996	15,695	15.60	244.8
FY1997			
FY1998			
FY1999			
FY2000			
FY2001	15,736	27.40	431.2
FY2002	16,603	20.56	341.4

1 Average wellhead prices were computed by dividing the gross value of production by the number of barrels extracted.

2 Due to a legal opinion on the confidentiality of tax records, the Montana Department of Revenue stopped providing data DNRC used to calculate the average price and valuation for individual fields. The DNRC data published for these years were summaries prepared by DoR. After 1997, DNRC stopped publishing this data table.

NOTE: Some oil production is exempt from state taxation and is not included in DoR's production figures. Wells are classified for tax purposes as either oil or gas wells; only oil from wells classified as oil wells is included in DoR figures. Accordingly, production figures from 1992 on are lower than those shown in Table P1.

¹ T.A. - Temporarily abandoned. ² CBM - Coalbed Methane ³ EOR - Enhanced Oil Recovery

NOTE: The Montana Board of Oil and Gas recently revised its record keeping procedures. The data for wells drilled since 1990 supercede those in the previous Annual Reviews. After 1990, the number of wells drilled no longer is broken out by "Development" and "Exploratory."

1 Includes 13,000 barrels from South Dakota in 1955.

NOTE: Data originally reported by the Montana Oil and Gas Conservation Division have been revised on the basis of further information received from individual refineries. The Oil and Gas Conservation Division data originally understated Canadian inputs and overstated Wyoming inputs to the Continental Oil refinery, at least for the years 1968-75. Canadian inputs to the Big West Oil and Westco refineries were apparently not reported to the Oil and Gas Conservation Division. Revised data are available only for the years 1972-75, but it is likely that Canadian inputs to these two refineries were significant before 1972.

1 In Montana "Other Petroleum Products" are used primarily in petroleum industry operations and as refinery fuels.

NOTE: DOE models provide the best consumption estimates available. However, some of the more dramatic year-to-year variation in consumption levels may be due to the models themselves or to changes in the models or data sources.

1999	2,253	112	54	420	22

¹ Includes deliveries for industrial use (including industrial space heating and farm use), oil company use, off-highway use, and "other" uses. Does not include use at electric utilities.

² DOE has numerous caveats on its allocation of LPG consumption to the various sectors.

³ Includes sales for agricultural use, construction use, and industrial and commercial use.

⁴ Includes industrial use, oil company use, and "other" uses.

NOTE: This table does not show the categories "asphalt and road oil" and "other petroleum products," which are consumed solely in the industrial sector. It also does not include kerosene, since the consumption has been minimal in recent years.

DOE models provide the best consumption estimates available. However, some of the more dramatic year-to-year variation in consumption levels may be due to the models themselves or to changes in the models or data sources.

* Less than 0.5.

¹ Includes military and non-military use.

² Includes deliveries for military use, railroad use and highway use.

³ Non-military use only of kerosene-type jet fuel.

⁴ DOE has numerous caveats on its allocation of LPG consumption to the various sectors.

⁵ This table does not cover all uses of gasoline included in "Highway Use of Motor Fuel" in Table P11.

⁶ Includes military use and railroad use.

NOTE: DOE models provide the best consumption estimates available. However, some of the more dramatic year-to-year changes in consumption levels may be due to the models themselves or to changes in the models or data sources.

SOURCE: U.S. Department of Energy, Energy Information Administration, *State Energy Data Report, Consumption Estimates, 1960-99* (DOE/EIA 0214; <http://www.eia.doe.gov/emeu/sedr/contents.html#HTML%20Tables>).

Table P11. Motor Fuel Use, 1950-2000 (thousand gallons)

Year	Highway Use of Motor Fuel			Nonhighway			TOTAL Consumption of Motor Fuel

1999	480,754	185,212	665,966	26,486	-		692,452
2000	469,683	190,450	660,133	26,394	-		686,527

NOTE: Motor fuel is defined by the US Department of Transportation as all gasoline covered by state motor fuel tax laws plus diesel fuel and LPG used in the propulsion of motor vehicles. (The Montana data do not include any LPG.) Gasohol is included with gasoline. Military use of motor fuel and aviation jet fuel use are excluded from DOT data. Figures for highway use of fuels may be understated because of refunds given on fuel for nonhighway use such as agriculture.

Starting in 1984, losses due to evaporation and handling are no longer calculated by FHWA. Total consumption of motor fuel from 1984-2000, therefore, does not include this figure. To compare the total for these years to the total for the previous years, the losses should be subtracted from the 1950-83 total consumption column.

¹ Gasohol was not defined in federal tax law until 1979. Products later defined as gasohol (10 percent ethanol by volume) were taxable as gasoline until 1979. From 1979 to 1983, gasohol was exempt from gasoline tax. Price series data on gasohol were not available.

² Blends using methanol, and amounts of ethanol between 5.7 and 10 percent, were taxed at lower rates.

NOTES: Price is average of all grades, in nominal dollars. Gasoline and diesel prices include state and federal per gallon fuel taxes. All prices except 1984-2001 gasoline prices are derived from the *State Energy Price and Expenditure Report*, which reports prices in \$/million Btu. The source document omits federal diesel fuel tax from 1970-82; therefore, the federal tax has been added and is included in the 1970-82 diesel prices listed above. See the source document for information on changes over time in the data sources and in the estimation methods used. In particular, note that diesel prices from 1984 forward are estimated as the ratio of the PAD IV diesel fuel price to the PAD IV motor gasoline price times the State motor gasoline price, plus federal and state per gallon taxes. PAD IV includes Colorado, Idaho, Montana, Utah and Wyoming.

SOURCES: Gasoline prices for 1964-2001 are from U.S. Department of Energy, *Petroleum Marketing Annual*. Refiner/Reseller Motor Gasoline Prices by Grade, Sales to End Users Through Company Outlets, annual reports. 1985-2001 (EIA-0487). All other fuel prices are from U.S. Department of Energy, *Energy Information Administration, Petroleum Marketing Annual*, Refiner/Reseller Motor Gasoline Prices by Grade, Sales to End Users Through Company Outlets, annual reports. 1970-99 (EIA-0376). Tax figures are from U.S. Department of Transportation, *Federal Highway Statistics*, annual reports 1970-2000.
